

# **Mathematics in Motion: Animating Math Concepts for the Web**

Courtney Yatteau

# Agenda

1. Why Animate Math?
2. Tools for Motion
3. RAPID Framework
4. Demos
5. Takeaways

[github.com/cyatteau/

# Today's Objectives

- Understand the RAPID workflow for animations
- Learn to apply math to real-world animations

# Why animate math on the web?

- Motion makes abstract ideas intuitive
- Interactivity turns watchers into explorers
- Runs anywhere a browser runs
- Same techniques power media/data viz, games

# Research-backed benefits

1. Animated/interactive visuals increase engagement & retention
2. Learning improves when learners can control pace and inputs

# Tools to Animate on the Web

- CSS (transforms, keyframes, math functions)
- Canvas + JavaScript
- WebGL / Three.js

# RAPID Framework

- **Receive**
- **Apply**
- **Project**
- **Iterate**
- **Draw**

# R — Receive

Read sliders, mouse drags, or microphone data

# A - Apply

Take the received input and feed it into your mathematical model.

# P - Project

Map your mathematical results into the space you're drawing in (e.g., pixels, canvas coords, or map coords).

# I - Iterate

Repeat the process to create motion, updating parameters each frame.

# D - Draw

Render the current state to the screen so the user can see the results.

# Demo 1A: Quadratic Transformer

# Demo IB: Real-World Example

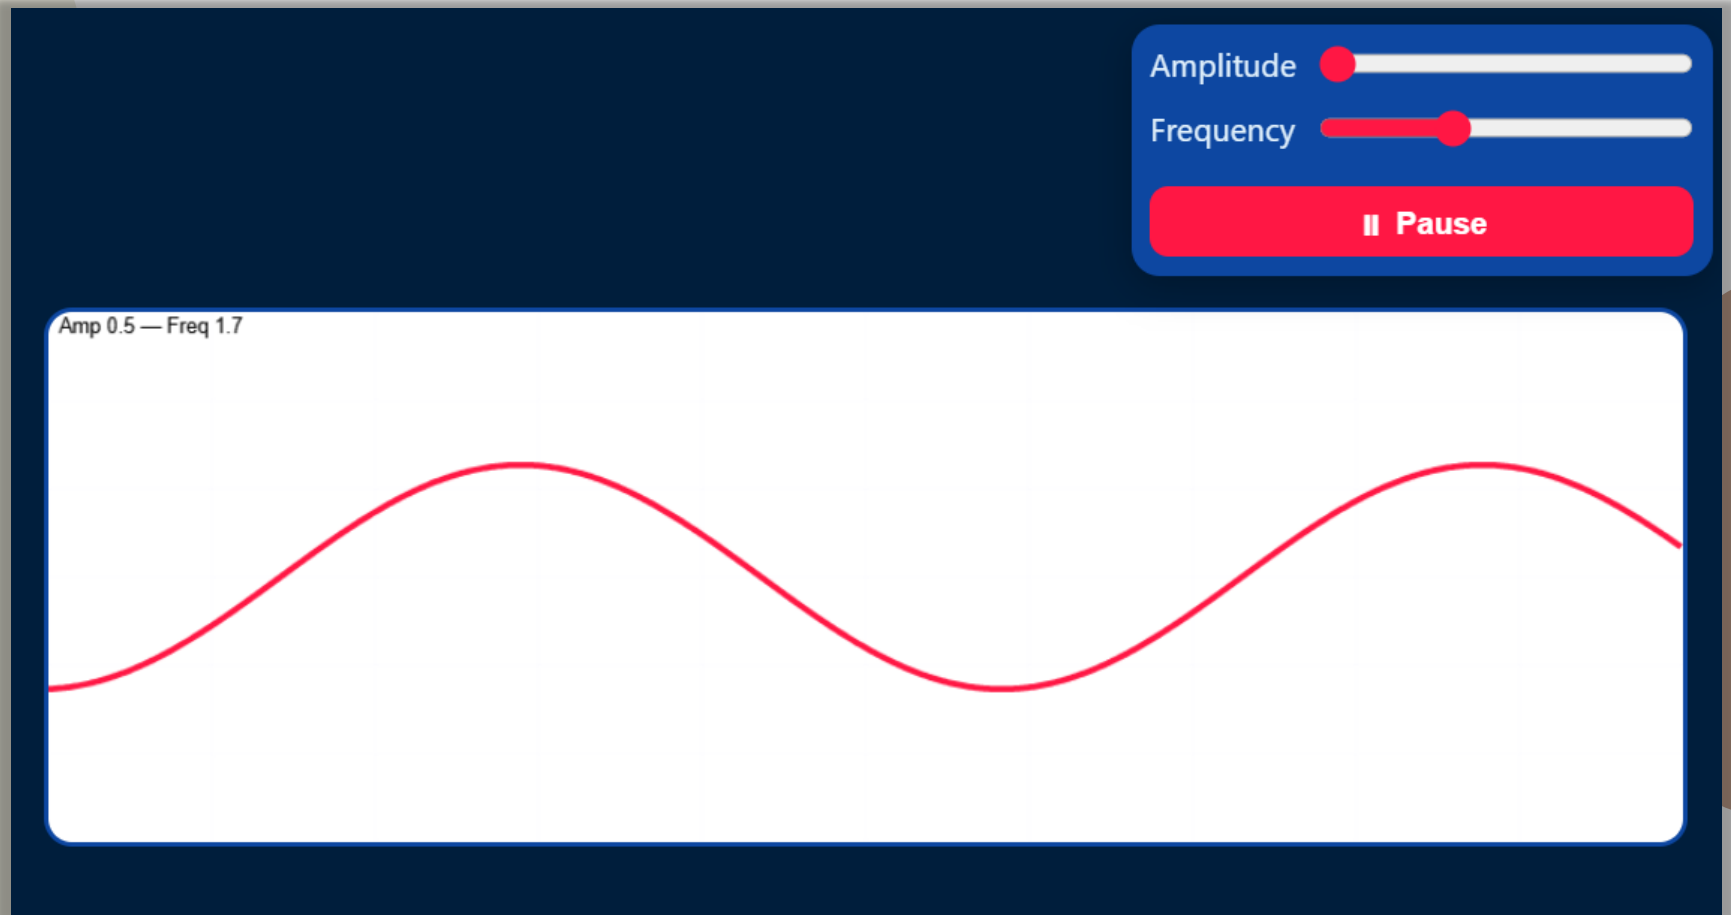

Baseball Savant Home-Run Derby uses same parabola

- **Receive:** radar
- **Apply:** projectile formulas
- **Project:** 3D coordinates to WebGL2 scene
- **Iterate:** requestAnimationFrame
- **Draw:** Render arcs & balls on the canvas

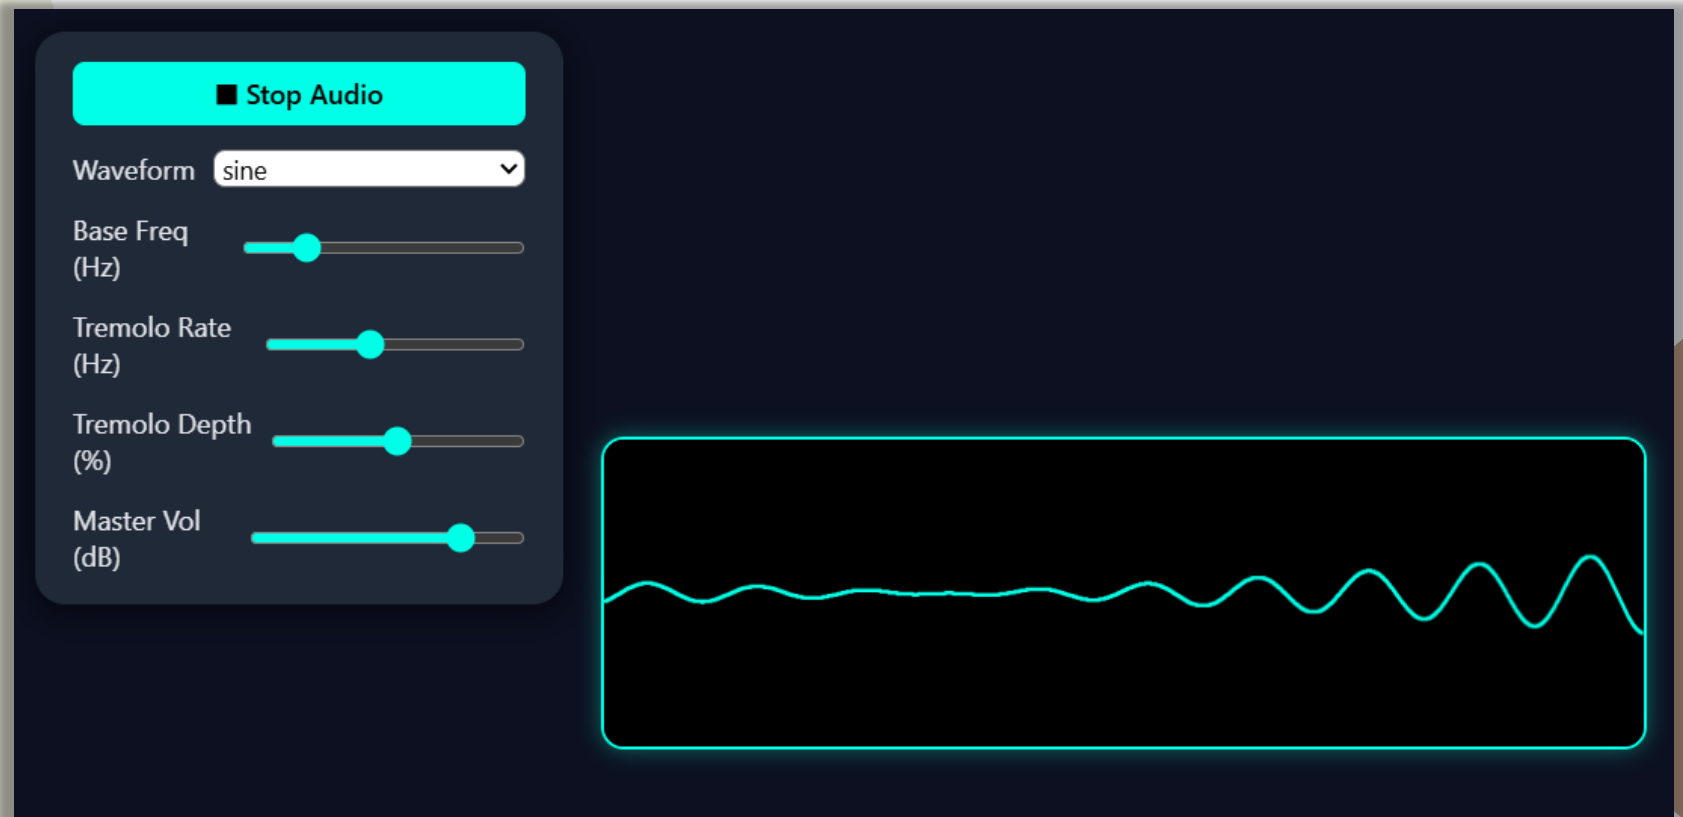

[https://baseballsavant.mlb.com/hr\\_derby](https://baseballsavant.mlb.com/hr_derby)

# Demo 2a: Sine-Wave Visualizer

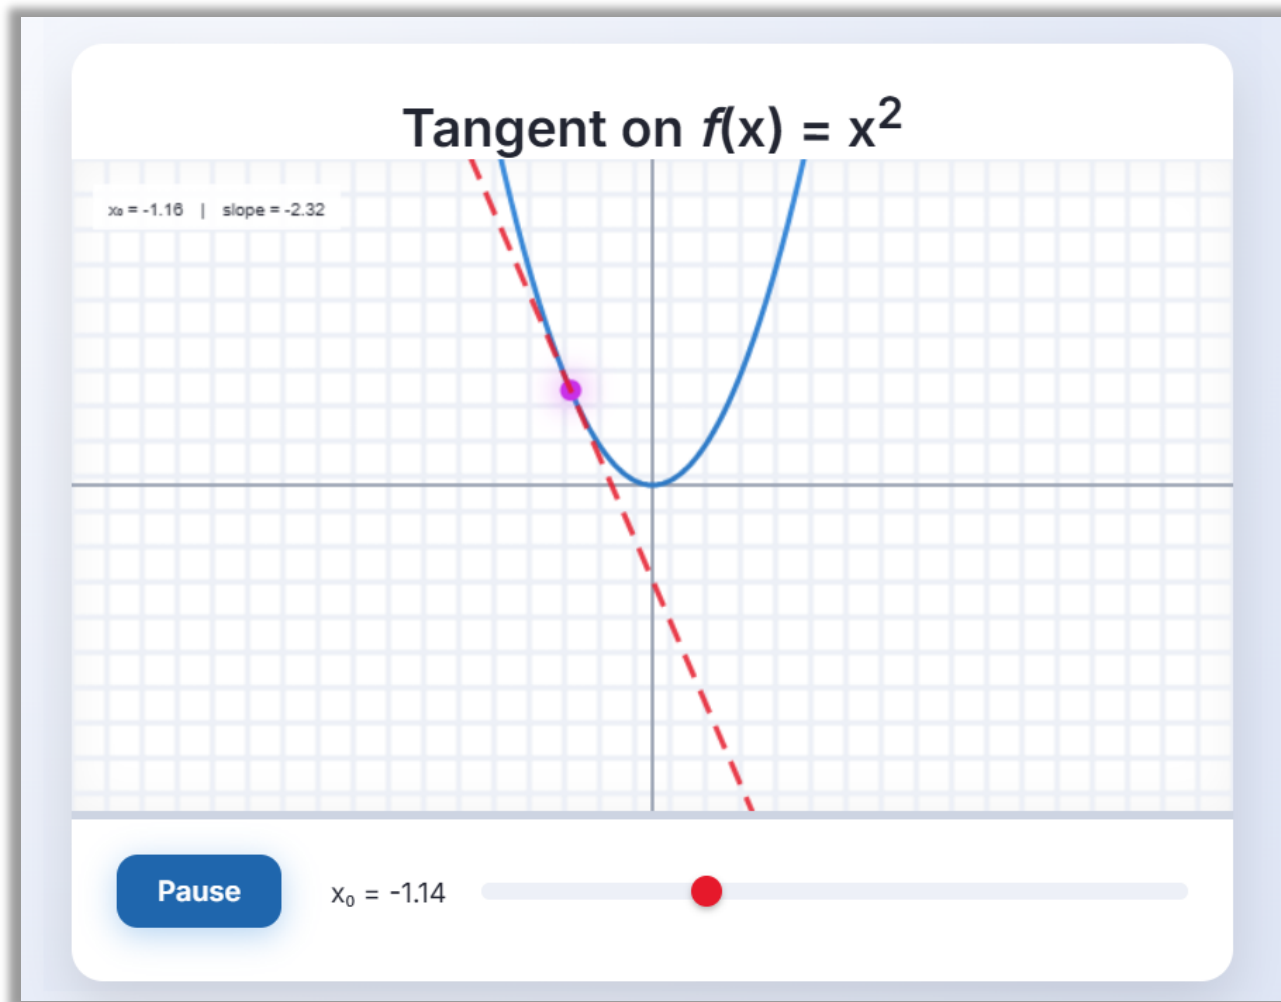

# Demo 2b: Tremolo Pedal Demo

# Demo 3a: Tangent Explorer

# Demo 3b: Instant Speedometer

Distance vs Time ( $s = t^2$ )

Time •  $t = 1.18$  s

Distance (m)

**1.39**

Instant Speed

**2.36**

# Demo 4a: Riemann Sums

$$\int \sin(x) \, dx \text{ on } [0, \pi]$$

Rectangles n:  16

# Demo 4b: Calories Burned

## Calories Burned in 30 Minutes

Drag the slider to pick how many slices (N) you break 30 minutes into. Each slice covers  $\Delta t = 1800 \text{ s} \div N$ . Hover a bar below to see:

Slices (N): 62   $\Delta t: 29.0 \text{ s}$

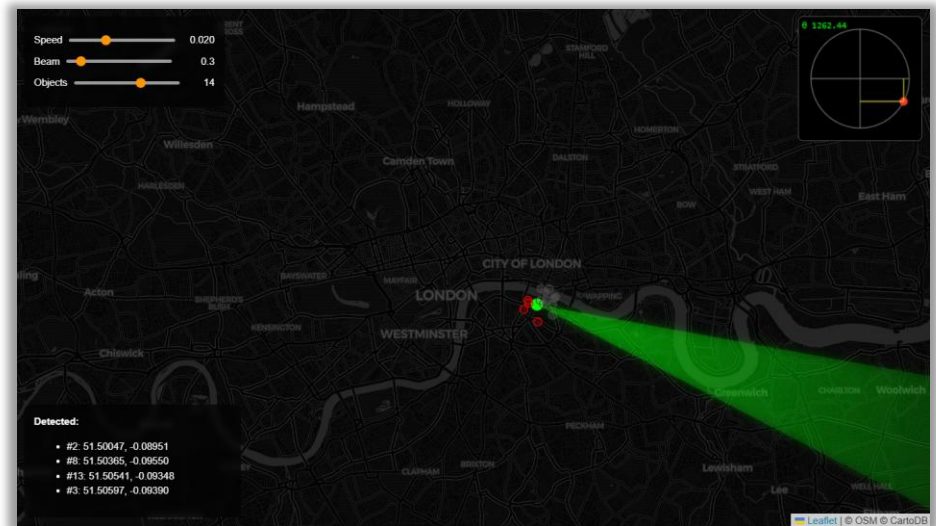

Slice at 28:33  $\rightarrow$   $HR \approx 86 \text{ bpm}$   
 $0.14 \text{ cal/s} \times 29.0 \text{ s} = \mathbf{4.18 \text{ cal}}$   
Running total  $\approx 226.26 \text{ cal}$

**Approx 234.39 cal**

# Demos 5a and 5b: Unit Circle and Radar Map

## Unit Circle → Sine & Cosine Projections

$\theta$  4.32 rad  
 $\cos \theta$  -0.39  
 $\sin \theta$  -0.92

# Key Takeaways

- RAPID is a reusable mental model for math in motion
- Swap formulas; keep the pipeline
- Canvas, Audio, Maps - same five steps

# Thank you, Beer City Code!
